This e-mail is to document the agreements and path forward for evaluation of an industrial worker in the Pantex playas.

A standard TCEQ industrial worker will be assessed for the entire playa area within the fence line to correspond to the general work patterns of a Pantex-specific worker. A hotshot analysis will be performed to determine if any areas of the playa will need to be addressed for current or future workers (deed recordation).

As previously noted to Shannon, we have already completed the hotshot evaluation and have found we don't have any hotshot for an industrial worker. The maximum concentrations of COPCs at the playas fall below the RRS 2 SAI MSC for an industrial worker.

I have attached the site-specific analysis completed to document work that is performed in the playas at Pantex. This documentation was previously provided to Shannon to support our request for use of the entire playa area as an exposure area. This paper demonstrates the types of workers present, the type of work performed, and provides an understanding of the spatial work patterns for each of the workers.

This information will be included in the report to provide an understanding of the worker exposure area. I did not include the figures because of the file size. If you would like to see those figures, please let me know and I will send those separately.

If you have questions, please let me know.

Thanks,
Michelle
